

In November 2007 S.C.O.R.E. Limited started providing Safety~Kwik Ditch Magnets to Oilbelt Services Limited for their land drilling rig operations. To date the magnets have worked successfully on over four large milling jobs.

Special Consultants, Oilfield Rentals, Equipment Limited in conjunction with PSR Incorporated have taken this simple oilfield tool called a “Safety~Kwik Ditch Magnet” and made it intrinsically safe. The S.C.O.R.E. Limited Safety~Kwik Ditch Magnet with the UHMW non-metal and abrasive superior TEFLON type composite (patent pending) is the most powerful HSE oriented ditch magnet in the industry that helps AVOID HAND INJURY and speeds up cleaning/clearing METAL SWARF & METAL DEBRIS magnetically attached to the magnet...SAFELY.

In the past, oilfield workers cleaned ordinary ditch magnets (prior to the Safety~Kwik Ditch Magnet) by scraping sharp metal particles with their hands and possibly a piece of wood. Even when workers used a hand scraper or other such devices to clean off metal from ordinary ditch magnets they have contact with the SWARF/DEBRIS using their hands. Often, this causes piercing hand injuries when metal particles penetrate workers gloves and stick into workers hand or fingers like wood splinters.

Because of noticeable filth, bacteria and chemicals commonly associated with drilling fluids returning from downhole during drilling & completion operations, potential metal splinters piercing a worker's hands or fingers might contribute to more than just a bleeding injury and could create a serious incident and medical injury litigation.

The simple device shows the power of people with foresight coming together as a team with a focus on HSE to create safe tools for the oil industry.
